

## Process control

Our goal as a service provider is to create competitive advantages, not only for us but for you as well.

Accordingly, we are always looking for improvements and further development potential in our products and processes. The experience we continually gather in project work and - more importantly, the suggestions and needs of our customers - provide the input for innovative development.

We created our R&D team with the specific mission of understanding and implementing your ideas. Made up of specialists from a variety of fields, they evaluate the potential of suggested improvements whether originated from customers or internally. Improvements with promising benefits are refined with equal portions of creativity and know-how and transformed into reality:

Control Technologies: Advanced PLC control technologies with computer-controlled remote sensors and frequency-controlled pumps provide maximum benefits in terms of cost efficiency, operational safety and environmental protection.

Pump development system: used in well regeneration as well as determination of hydraulic conductivity and sand content in accordance with DVGW and other test standards.

### Applications: Dewatering, groundwater control, well drilling and enviro-engineering

If you have any questions, please do not hesitate to contact us.
